

# Data Science Cheat Sheet

**Python Basics** 

# **BASICS, PRINTING AND GETTING HELP**

x = 3 - Assign 3 to the variable x**help(x)** - Show documentation for the **str** data type print(x) - Print the value of x help(print) - Show documentation for the print() function type(x) - Return the type of the variable x (in this case, int for integer)

# READING FILES f = open("my\_file.txt","r") file\_as\_string = f.read()

- Open the file my\_file.txt and assign its contents to **s** 

import csv f = open("my\_dataset.csv","r") csvreader = csv.reader(f) csv\_as\_list = list(csvreader)

- Open the CSV file my\_dataset.csv and assign its data to the list of lists csv\_as\_list

#### STRINGS

s = "hello" - Assign the string "hello" to the variable s

s = """She said, "there's a good idea."

- Assign a multi-line string to the variable s. Also used to create strings that contain both " and ' characters

len(s) - Return the number of characters in s

s.startswith("hel") - Test whether s starts with the substring "hel"

s.endswith("lo") - Test whether s ends with the substring "lo"

"{} plus {} is {}".format(3,1,4) - Return the string with the values 3, 1, and 4 inserted

s.replace("e", "z") - Return a new string based on s with all occurances of "e" replaced with "z"

s.split(" ") - Split the string s into a list of strings, separating on the character " " and return that list

# NUMERIC TYPES AND

# MATHEMATICAL OPERATIONS

i = int("5") - Convert the string "5" to the integer 5 and assign the result to i

f = float("2.5") - Convert the string "2.5" to the float value 2.5 and assign the result to f

5 + 5 - Addition

5 - 5 - Subtraction

10 / 2 - Division

5 \* 2 - Multiplication

3 \*\* 2 - Raise 3 to the power of 2 (or 32)

**27** \*\* (1/3) - The 3rd root of **27** (or  $\sqrt[3]{27}$ )

x += 1 - Assign the value of x + 1 to x

x -= 1 - Assign the value of x - 1 to x

#### LISTS

1 = [100,21,88,3] - Assign a list containing the integers 100, 21, 88, and 3 to the variable 1

1 = list() - Create an empty list and assign the result to 1

1[0] - Return the first value in the list 1

1[-1] - Return the last value in the list 1

1[1:3] - Return a slice (list) containing the second and third values of 1

len(1) - Return the number of elements in 1

sum(1) - Return the sum of the values of 1

min(1) - Return the minimum value from 1

max(1) - Return the maximum value from 1

1.append(16) - Append the value 16 to the end of 1

1.sort() - Sort the items in 1 in ascending order " ".join(["A", "B", "C", "D"]) - Converts the list

["A", "B", "C", "D"] into the string "A B C D"

#### DICTIONARIES

d = {"CA":"Canada", "GB": "Great Britain", "IN": "India" } - Create a dictionary with keys of "CA", "GB", and "IN" and corresponding values of of "Canada", "Great Britain", and "India"

d["GB"] - Return the value from the dictionary d that has the kev "GB"

d.get("AU", "Sorry") - Return the value from the dictionary d that has the key "AU", or the string "Sorry" if the key "AU" is not found in d

d.keys() - Return a list of the keys from d

d.values() - Return a list of the values from d

d.items() - Return a list of (key, value) pairs from d

# **MODULES AND FUNCTIONS**

The body of a function is defined through indentation.

import random - Import the module random from math import sqrt - Import the function sart from the module math

def calculate(addition\_one,addition\_two, exponent=1,factor=1):

result = (value\_one + value\_two) \*\* exponent \* factor return result

- Define a new function calculate with two required and two optional named arguments which calculates and returns a result.

addition(3,5,factor=10) - Run the addition function with the values 3 and 5 and the named argument 10

### **BOOLEAN COMPARISONS**

x == 5 - Test whether x is equal to 5

x != 5 - Test whether x is not equal to 5

x > 5 - Test whether x is greater than 5

x < 5 - Test whether x is less than 5

x >= 5 - Test whether x is greater than or equal to 5

x <= 5 - Test whether x is less than or equal to 5

x == 5 or name == "alfred" - Test whether x is equal to 5 or name is equal to "alfred"

x == 5 and name == "alfred" - Test whether x is equal to 5 and name is equal to "alfred"

5 in 1 - Checks whether the value 5 exists in the list 1 "GB" in d - Checks whether the value "GB" exists in the keys for d

### IF STATEMENTS AND LOOPS

The body of if statements and loops are defined through indentation.

```
if x > 5:
```

```
print("{} is greater than five".format(x))
elif x < 0:
```

print("{} is negative".format(x)) else:

print("{} is between zero and five".format(x))

- Test the value of the variable x and run the code body based on the value

# for value in 1: print(value)

- Iterate over each value in 1, running the code in the body of the loop with each iteration

while x < 10:

- Run the code in the body of the loop until the value of x is no longer less than 10

# Data Science Cheat Sheet

Python - Intermediate

## **KEY BASICS, PRINTING AND GETTING HELP**

This cheat sheet assumes you are familiar with the content of our Python Basics Cheat Sheet

- s A Python string variable
- i A Python integer variable
- **f** A Python float variable

- 1 A Python list variable
- d A Python dictionary variable

#### LISTS

- 1.pop(3) Returns the fourth item from 1 and
   deletes it from the list
- 1.remove(x) Removes the first item in 1 that is
   equal to x
- 1.reverse() Reverses the order of the items in 1
- 1[1::2] Returns every second item from 1, commencing from the 1st item
- 1[-5:] Returns the last 5 items from 1 specific axis

#### STRINGS

- **s.lower()** Returns a lowercase version of **s**
- s.title() Returns s with the first letter of every word capitalized
- "23".zfill(4) Returns "0023" by left-filling the string with 0's to make it's length 4.
- **s.splitlines()** Returns a list by splitting the string on any newline characters.
- Python strings share some common methods with lists
- s[:5] Returns the first 5 characters of s
- "fri" + "end" Returns "friend"
- "end" in s Returns True if the substring "end"
   is found in s

#### RANGE

Range objects are useful for creating sequences of integers for looping.

- range(5) Returns a sequence from 0 to 4 range(2000, 2018) - Returns a sequence from 2000
- range(0,11,2) Returns a sequence from 0 to 10, with each item incrementing by 2
- range(0,-10,-1) Returns a sequence from 0 to -9
  list(range(5)) Returns a list from 0 to 4

## DICTIONARIES

- max(d, key=d.get) Return the key that
   corresponds to the largest value in d
- min(d, key=d.get) Return the key that corresponds to the smallest value in d

#### SETS

my\_set = set(1) - Return a set object containing
the unique values from 1

- len(my\_set) Returns the number of objects in
  my\_set (or, the number of unique values from 1)
- a in my\_set Returns True if the value a exists in
   my\_set

#### **REGULAR EXPRESSIONS**

- import re Import the Regular Expressions module
  re.search("abc",s) Returns a match object if
  the regex "abc" is found in s, otherwise None
- re.sub("abc", "xyz", s) Returns a string where all instances matching regex "abc" are replaced by "xyz"

#### LIST COMPREHENSION

A one-line expression of a for loop

- [i \*\* 2 for i in range(10)] Returns a list of
  the squares of values from 0 to 9
- [s.lower() for s in 1\_strings] Returns the
   list 1\_strings, with each item having had the
   .lower() method applied
- [i for i in 1\_floats if i < 0.5] Returns the items from 1 floats that are less than 0.5

# FUNCTIONS FOR LOOPING

- for i, value in enumerate(1):
   print("The value of item {} is {}".
   format(i,value))
- Iterate over the list 1, printing the index location of each item and its value
- for one, two in zip(l\_one,l\_two):
   print("one: {}, two: {}".format(one,two))
- Iterate over two lists, 1\_one and 1\_two and print each value
- while x < 10:
  - x += 1
- Run the code in the body of the loop until the value of  $\boldsymbol{x}$  is no longer less than  $\boldsymbol{10}$

### DATETIME

- import datetime as dt Import the datetime
   module
- now = dt.datetime.now() Assign datetime
   object representing the current time to now
- wks4 = dt.datetime.timedelta(weeks=4)
- Assign a timedelta object representing a timespan of 4 weeks to wks4

- now wks4 Return a datetime object
  representing the time 4 weeks prior to now
- newyear\_2020 = dt.datetime(year=2020, month=12, day=31) - Assign a datetime object representing December 25, 2020 to newyear\_2020
- newyear\_2020.strftime("%A, %b %d, %Y")
   Returns "Thursday, Dec 31, 2020"
- dt.datetime.strptime('Dec 31, 2020',"%b
  %d, %Y") Return a datetime object
  representing December 31, 2020

#### RANDOM

- import random Import the random module
  random.random() Returns a random float
  - between **0.0** and **1.0**
- random.randint(0,10) Returns a random
  integer between 0 and 10
- random.choice(1) Returns a random item from
  the list 1

#### COUNTER

- from collections import Counter Import the
   Counter class
- c = Counter(1) Assign a Counter (dict-like)
   object with the counts of each unique item from
   1, to c
- c.most\_common(3) Return the 3 most common
   items from 1

#### TRY/EXCEPT

Catch and deal with Errors

- 1\_ints = [1, 2, 3, "", 5] Assign a list of
   integers with one missing value to 1\_ints
- 1\_floats = []
  for i in 1\_ints:
  - try:
  - 1\_floats.append(float(i))
    except:
  - 1\_floats.append(i)
- Convert each value of l\_ints to a float, catching and handling ValueError: could not convert string to float: where values are missing.
